The overspeed switch function on the 90mm range – a sturdy mechanical security module without external power supply:
- radial commutation centrifugal switch without permanent contact.
- high quality mechanics reliability.
- excellent repeatability.
- secured system, works without power supply.
- modular mounting possibility.
- commutation speed: standard calibration range between 800 and 4,000 rpm (rotation per minute).

Especially designed for heavy duty industry (steel and paper mills, lumber, cranes, engine etc...). Sturdy compact conception. Excellent resistance to shocks/vibrations and to extreme axial/radial loads.
12mm or 11mm solid shaft with 115mm REO (Euroflange B10) for tacho-generator type mounting.

The compactness of the assembly, which can be proposed by BEI SENSORS, allows the combination of overspeed switch and encoder presenting a particularly interesting cost / performances relation.

**EXAMPLE: INCREMENTAL ENCODER GHM9_11 WITH OVERSPEED SWITCH**

The commutation speed n_s is definitely calibrated in our factory.

Right or left rotation direction.

The switching speed n_s is defined for an acceleration = 100 s⁻² (other, consult us).

Nota: 1 rad.s⁻² ↔ 9,55 rpm.s⁻¹

The hysteresis is about −3% in counter clockwise direction compared with clockwise direction.

It is advised to choose the switching speed n_s in order that n_s > 1.15 n_n (n_n: working speed, nominal speed).

The centrifugal relay must be used only in the case of an increasing speed.

In decreasing speed, the centrifugal switch will open automatically at a slower speed of approximately 40% of the calibrated switching speed n_s.

In the case of a higher acceleration than 100 s⁻², the switching speed will be higher (n_s, cf here-under drawing).

Shocks / impacts can create premature switching or transient opening. This is particularly the case when the switch’s direction of action and the shock are the same. Rotating the mounting position (60° division on flange) reduces the problem.

STANDARD CONNECTION

With 4 pinout solenoid valve connector.

Contact 1 to 3 can be connected according to the desired configuration (rest, work or opposite).

The earth pin of the connector must be connected to the ground of the installation.

AVAILABLE COMBINATION [Consult us for special version: ex: flange / connection / specific speed...]

Available combination:
- incremental encoder + overspeed switch,
- tacho-encoder + overspeed switch,
- absolute encoder + overspeed switch,
- incremental encoder + opto-tacho + overspeed switch,
- overspeed switch + overspeed switch ...

Standard speeds (rpm) : 1 000, 1 200, 1 500, 1 800, 3 000 (consult us for other speed).

Reference: consult us.

Note: The switch commutation speed is calibrated in our factory, no correction and no later modification is possible.
